

MPIDR POSTER TEMPLATE

Ole Hexel

Max Planck Institute for Demographic Research

This is a title

The building blocks of the poster are “blocks” within columns. There are also subcolumns, inner blocks, and notes. Have a look at the documentation: <https://www.ctan.org/pkg/tikzposter>

Within blocks, you can do most of what you can do in any \LaTeX document. Special rules apply for figures and tables. See the examples in this document.

Unfortunately, the layout options are limited to rectangles within rectangles. If you wanted a spiral or tree layout, you’re out of luck.

As you might have guessed from the package name, the whole document is just a special kind of `tikz` figure. If you’re familiar with `tikz`, you may have some luck manipulating the package code and creating more layout options or shapes.

This is a “dense” block

The block above this one uses the default block style. I thought that it wasted too much space. This block uses the custom “dense” block style. It reduces many of the margins and distances. You can switch between block styles at any point in the document and as often as you like.

Columns can have different widths.

This is content.

Figures have to be enclosed in blocks

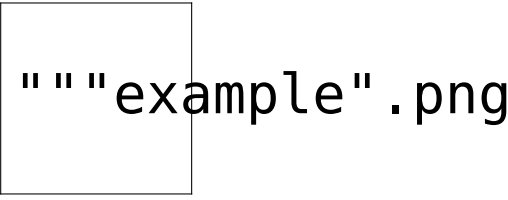

Fig. 1: Caption goes here

Columns can have subcolumns.

This is an inner block

An inner block is a special kind of block.

Tables too have to be enclosed in blocks.

Below is table 1 as an example.

Tab. 1: Caption goes here	
EN	DE
Hello	Hallo
How are you?	Ich will nur höflich sein.
